

Helpdesk SimulationTicket Portfolio

Week 1 — IT Support Investigation, Troubleshooting and Customer Communication

Candidate: Thabang Norman Lesotho

This portfolio documents five completed Zendesk ticket logs from the selected Microsoft 365 and Network & Performance support scenarios. The ticket evidence is based on the supplied screenshots, not on the sample ticket wording in the playbook.

Portfolio overview

The project instructions require two selected scenario groups, a minimum of five completed Zendesk tickets, clear investigation and troubleshooting records, research and tools used, professional customer communication, and a resolution or escalation outcome. This portfolio follows that structure.

Selected scenario 1	Microsoft 365 & Common Helpdesk Issues — Teams and OneDrive support
Selected scenario 2	Network & Performance Support — Wi-Fi, IP and DNS connectivity
Completed tickets	Five ticket records
Ticket distribution	Two Microsoft 365 tickets and three network/connectivity tickets
Evidence method	Zendesk screenshots arranged in support-process order within each ticket

Ticket order

1. Ticket 1 — OneDrive Keeps Asking Me to Sign In — Question #36
2. Ticket 2 — Microsoft Teams Showing “You’re Offline” Despite Internet Connection — Question #38
3. Ticket 3 — Laptop Connected to Wi-Fi but Showing “No Internet Access” — Question #40
4. Ticket 4 — Unable to Access Certain Websites — Question #35
5. Ticket 5 — Wi-Fi Keeps Disconnecting — Question #39

Documentation note

The scenario guide provides sample issues and recommended evidence points. The records below use the actual tickets and actual troubleshooting shown in the supplied Zendesk screenshots. Where a root cause is not explicitly confirmed in the screenshots, it is described as a working diagnosis rather than presented as a fact.

OneDrive Keeps Asking Me to Sign In — Question #36

Scenario group	Microsoft 365 & Common Helpdesk Issues
Evidence order	Screenshots are arranged from initial report to investigation, troubleshooting, confirmation, and closure.

Issue summary

The customer reported that OneDrive repeatedly requested sign-in. After signing in successfully, the prompt returned and file synchronization stopped.

IT Support Technician view

Investigation and findings

- The issue was specific to OneDrive on the customer's device.
- The repeated prompt occurred during normal use and was linked to files no longer syncing.
- The customer later confirmed that signing out and signing back in resolved the issue.

Troubleshooting performed

1. Requested information about when the issue started, any error message, what the customer was doing when the prompt appeared, and troubleshooting already attempted.
2. Instructed the customer to right-click the OneDrive taskbar icon, open Settings, select Account, sign out, and sign back in.
3. Asked the customer to confirm whether the sign-in prompt returned and whether files were syncing normally.

Research and technical reasoning

The evidence supports a local OneDrive account-session or authentication-state problem. The screenshots do not confirm a tenant-side account or licensing fault, so the documentation records the local sign-out/sign-in repair as the successful first-line resolution.

Tools and systems used

- Zendesk ticket conversation and internal notes
- OneDrive taskbar icon and Account settings
- Windows desktop sign-out and sign-in workflow

User-friendly explanation

OneDrive is like a courier that needs a valid delivery badge before it can move files between the computer and the cloud. Signing out and back in issued a fresh badge so the courier could continue working.

Everyday analogy

The response acknowledged the repeated prompts, requested the relevant diagnostic details, provided clear steps, and confirmed the resolution after the customer reported that OneDrive was working normally.

Customer communication

OneDrive was repeatedly losing or rejecting its active sign-in session. After the customer signed out and signed back in, the prompt stopped appearing and files resumed syncing.

Resolution or escalation

Resolved at first line. The customer confirmed that the sign-in prompt stopped and file synchronization returned to normal. No escalation was shown in the ticket.

Screenshot evidence — chronological order

The upload filenames are not chronological. The sequence below follows the support workflow shown in the Zendesk conversation. Each caption identifies the purpose of the screenshot in the ticket record.

Evidence 01 — Original customer report

Evidence 02 — Technician acknowledgement and investigation handover

Evidence 03 — Request for additional diagnostic information

Evidence 04 — Internal issue summary

Evidence 05 — Customer follow-up confirming the prompt continued

Evidence 06 — Public troubleshooting instructions: sign out and sign back in

Evidence 07 — Internal note recording that the first attempt had not yet resolved the issue

Evidence 08 — Customer confirmation that OneDrive was working normally

Evidence 09 — Internal resolution note

Evidence 10 — Final customer-facing closure message

Microsoft Teams Showing “You’re Offline” Despite Internet Connection — Question #38

Scenario group	Microsoft 365 & Common Helpdesk Issues
Evidence order	Screenshots are arranged from initial report to investigation, troubleshooting, confirmation, and closure.

Issue summary

The customer reported that Microsoft Teams showed “You’re offline” even though the computer was connected to the internet. Messages and recent conversations were not updating.

IT Support Technician view

Investigation and findings

- The customer had already restarted Teams and signed out and back in without resolving the issue.
- The failure affected Teams communication and access to recent conversations or shared files.
- The customer later confirmed that Teams was working properly after the additional troubleshooting steps.

Troubleshooting performed

1. Requested confirmation of when the issue started, whether the desktop app, web app, or both were affected, the exact error message, and previous steps attempted.
2. Asked the customer to fully quit Microsoft Teams and restart the computer.
3. Instructed the customer to reopen Teams, sign out, and sign back in.
4. Asked the customer to test Teams in a web browser.
5. Directed the customer to use Windows application settings to open Microsoft Teams Advanced options and select Repair.
6. Requested a retest of messages and shared files after reopening Teams.

Research and technical reasoning

The troubleshooting focused on separating a Teams application problem from a general internet problem. The steps progressed from restarting the application and session to repairing the installed Teams application.

Tools and systems used

- Zendesk ticket conversation
- Microsoft Teams desktop application
- Microsoft Teams web access
- Windows Settings > Apps > Installed apps > Microsoft Teams > Advanced options

User-friendly explanation

This is like having a working phone signal while one messaging app is stuck offline. The phone can still connect generally, but that app needs to be restarted or repaired so it can reconnect to its own service.

Everyday analogy

The technician acknowledged the customer's previous attempts, gathered targeted information, provided a clear escalation path from simple to more advanced steps, and confirmed the outcome once the customer retested Teams.

Customer communication

The internet connection was available, but Teams was not maintaining a working connection to its service. Restarting, re-authenticating, testing the web version, and repairing the application addressed the Teams client rather than treating the whole network as unavailable.

Resolution or escalation

Resolved at first line. The customer confirmed that Teams was working properly and the ticket was closed as solved.

Screenshot evidence — chronological order

The upload filenames are not chronological. The sequence below follows the support workflow shown in the Zendesk conversation. Each caption identifies the purpose of the screenshot in the ticket record.

Evidence 01 — Original customer report

Hi Zizipo,
I'm taking over your request and have reviewed the conversation so far. I'll help investigate the Microsoft Teams "You're offline" message.
Before I begin, please confirm:
- When the issue started
- Whether Teams is affected on the desktop app, web app, or both
- Any error message shown besides "You're offline"
- Which troubleshooting steps you have already tried, such as restarting Teams or signing out and signing in again
Once you confirm these details, I can start investigating further.

Laptop Connected to Wi-Fi but Showing “No Internet Access”

— Question #40

Scenario group	Network & Performance Support
Evidence order	Screenshots are arranged from initial report to investigation, troubleshooting, confirmation, and closure.

Issue summary

The customer reported that a Dell Latitude 5420 connected to the office Wi-Fi but displayed “No Internet, secured.” Websites, cloud services, Microsoft 365 applications, and other work resources could not be accessed.

IT Support Technician view

Investigation and findings

- The issue began that morning and occurred intermittently.
- Other devices on the same office Wi-Fi could access the internet normally.
- The customer had already restarted the laptop, reconnected to Wi-Fi, and moved closer to the wireless access point.
- The issue was therefore isolated to the laptop rather than treated as a network-wide outage.

Troubleshooting performed

1. Confirmed the laptop model, start time, frequency, affected devices, exact error message, and steps already attempted.
2. Disconnected from the office Wi-Fi and reconnected.
3. Opened Command Prompt and ran ipconfig /flushdns.
4. Ran ipconfig /release.
5. Ran ipconfig /renew.
6. Restarted the laptop.
7. Reconnected to the office Wi-Fi and tested the internet connection.

Research and technical reasoning

The troubleshooting targeted a device-specific IP or DNS state. Releasing and renewing the IP lease refreshed the laptop's network configuration, while flushing DNS removed cached name-resolution data. The screenshots show a successful customer retest after these steps.

Tools and systems used

- Zendesk messaging conversation
- Windows Wi-Fi connection
- Command Prompt
- `ipconfig /flushdns`
- `ipconfig /release`
- `ipconfig /renew`

User-friendly explanation

A Wi-Fi connection is like arriving at a hotel. Connecting to the Wi-Fi gets you into the lobby, but the laptop still needs a valid room number and a working directory to receive deliveries. Releasing and renewing the IP address is like checking in again with the correct room assignment.

Everyday analogy

The technician moved from automated initial guidance to a human investigation, collected the device-specific facts, explained the next step, and provided a numbered command sequence. The customer was asked to retest and then confirmed that the connection was working.

Customer communication

The laptop was connected to the wireless network but was not successfully completing internet access. Refreshing the local DNS cache and renewing the network address restored connectivity.

Resolution or escalation

Resolved at first line. The customer confirmed that the internet connection was working again. The ticket record also shows a 5/5 satisfaction rating.

Screenshot evidence — chronological order

The upload filenames are not chronological. The sequence below follows the support workflow shown in the Zendesk conversation. Each caption identifies the purpose of the screenshot in the ticket record.

Evidence 01 — Initial messaging conversation and customer report

The screenshot displays a Zendesk ticket interface for a user named 'Web User 6aa3ae76b6616e20cf983c5e'. The ticket is titled 'Question #40' and is marked as 'Solved'. The conversation is titled 'Conversation with Web User 6aa3ae76b6616e20cf983c5e' and is 'Via messaging'. The ticket status is 'Negative'. The left sidebar shows the ticket details, including the requester, assignee, followers, form, on-hold status, and re-open period. The main chat area shows the initial message from the customer: 'hey, i am experiencing a network connectivity issue with my work laptop. The laptop successfully connects to the office Wi-Fi network, but the connection status displays "No Internet Access." As a result, I am unable to access websites, cloud services, Microsoft 365 applications, or company resources that require an internet connection. I have tried disconnecting and reconnecting to the Wi-Fi network, restarting the laptop, and moving closer to the wireless access point, but the issue remains unresolved. This problem is preventing me from carrying out my daily responsibilities and accessing important work-related resources. Could you please investigate the issue and assist with restoring internet connectivity?'. The right sidebar shows the user's profile, local time, language, notes, device information, and pages viewed. The bottom of the interface shows the 'Apply macro' button and the 'Submit as Solved' button.

Evidence 02 — Automated initial troubleshooting guidance

The screenshot displays the same Zendesk ticket interface as Evidence 01, but with updated content. The ticket is still 'Solved' and 'Via messaging'. The main chat area shows the AI agent's response: 'Thank you for your patience while I locate further troubleshooting steps. Please check if other devices have the same issue, restart your laptop and router, verify your Microsoft 365 sign-in, and clear your browser cache. If the problem persists, submit a support request with device details and error messages.' The customer's response is: 'may i talk to an agent please.' The right sidebar shows the user's profile, local time, language, notes, device information, and pages viewed. The bottom of the interface shows the 'Apply macro' button and the 'Submit as Solved' button.

Evidence 03 — Customer requests assistance from a technician

Evidence 04 — Technician requests device and connectivity details

Evidence 05 — Customer provides the connectivity problem statement

Evidence 06 — Customer provides the device, timing, error, and previous troubleshooting details

Evidence 07 — Technician confirms the diagnosis direction and summarizes the facts

Evidence 08 — Technician provides the final command-based troubleshooting steps

Evidence 09 — Customer confirms the connection is working and technician closes the request

Evidence 10 — Ticket record showing the 5/5 customer rating

Evidence 11 — Conversation view showing the earlier troubleshooting exchange

TICKET 4

Unable to Access Certain Websites — Question #35

Scenario group	Network & Performance Support
Evidence order	Screenshots are arranged from initial report to investigation, troubleshooting, confirmation, and closure.

Issue summary

The customer could access some websites but could not access Microsoft Teams and SharePoint reliably. The affected Windows laptop displayed “This site can’t be reached,” while other devices on the same Wi-Fi network could access the services normally.

IT Support Technician view

Investigation and findings

- The problem appeared limited to specific work-related websites and the customer's laptop.
- Other websites and other devices on the same Wi-Fi were working.
- The customer reported that Microsoft Teams features other than the affected SharePoint-related access were functioning normally.
- The initial checks did not resolve the problem, so DNS and network configuration became the main investigation path.

Troubleshooting performed

1. Requested the affected websites or URLs, error message, frequency, affected devices, and previous troubleshooting.
2. Confirmed whether the issue affected the laptop only or multiple devices.
3. Tested Microsoft Teams and SharePoint to identify whether the issue was specific to work-related websites.
4. Checked whether other websites could be accessed normally.
5. Reviewed the laptop's browser, network, and DNS configuration.
6. Flushed the DNS cache and refreshed the network configuration.
7. Retested Microsoft Teams, SharePoint, and the affected work resources.

Research and technical reasoning

The evidence points to a laptop-specific DNS or network-resolution issue rather than a general internet outage. The resolution note explicitly records that DNS cache and network configuration were refreshed using `ipconfig /flushdns`, `ipconfig /release`, and `ipconfig /renew`.

Tools and systems used

- Zendesk ticket conversation and internal notes
- Microsoft Teams and SharePoint
- Web browser error message
- Windows network configuration
- Command Prompt
- `ipconfig /flushdns`
- `ipconfig /release`
- `ipconfig /renew`

User-friendly explanation

DNS is like a phone’s contact list. You may be able to call some people, but if one contact has an outdated number, that person cannot be reached until the contact information is refreshed.

Everyday analogy

The technician used staged communication: first gathering facts, then explaining the investigation, then reporting that the first checks had not resolved the issue, and finally confirming the resolution after the customer retested.

Customer communication

DNS translates a website name into the network address needed to reach it. In this case, general browsing worked, but the laptop was failing to reach certain work-related destinations. Refreshing the DNS and network configuration corrected the local lookup or connection state.

Resolution or escalation

Resolved at first line. The customer confirmed that Microsoft Teams and SharePoint were loading normally and that the work-related resources were accessible again.

Screenshot evidence — chronological order

The upload filenames are not chronological. The sequence below follows the support workflow shown in the Zendesk conversation. Each caption identifies the purpose of the screenshot in the ticket record.

Evidence 01 — Initial technician request for affected websites and diagnostic details

Evidence 02 — Customer reports the checks were completed but the issue remained

The screenshot displays a Zendesk ticket titled "Unable to Access Certain Websites" with a status of "Solved" and a priority of "Question #35". The requester is Lerato Zitha. The ticket is assigned to "All Zendesk ... /Thabang No...". The form is set to "Default Ticket Form". The summary field is empty. The summary date and time are also empty. The summary agent ID is empty. The ticket is created via email and is marked as negative. The ticket description states: "I completed the checks." followed by a bulleted list of actions: "Microsoft Edge and Microsoft Teams are updated.", "I closed and reopened Microsoft Teams, but the issue was still present.", "I signed out of Teams and signed back in with my Microsoft 365 account.", "I confirmed that I am signed in with the correct account and that my internet connection is working.", "SharePoint was still showing 'This site can't be reached.'", and "Other Teams features are working normally, and I did not receive an access or permissions error." The ticket concludes with "The issue is still occurring on my laptop." The ticket is public and is addressed to Lerato Zitha. The interaction history shows a single entry: "Unable to Access Certain Websites" from yesterday at 14:29, with a status of "Needs Attention!". The ticket is currently "Stay on ticket" and can be "Submitted as Solved".

Evidence 03 — Internal initial investigation

The screenshot displays the same Zendesk ticket, but with an internal investigation comment added. The comment is from Thabang Norman Lesotho, marked as "Internal", and was posted 18 minutes ago. The comment text reads: "Initial Investigation: The user reports that some websites load normally while others fail to load, despite the internet connection appearing to be active. The issue may be related to DNS resolution, browser configuration, network filtering, or connectivity to specific websites. I will first determine whether the problem affects specific websites or multiple websites and whether the issue is isolated to the user's laptop or the network." The comment is addressed to Lerato Zitha, who is also the requester. The ticket is currently "Stay on ticket" and can be "Submitted as Solved".

Hi Lerato,
Thank you for providing the additional details.
I understand that Microsoft Teams and SharePoint are intermittently showing a "This site can't be reached" error on your Windows laptop using Microsoft Edge, while other devices on the same Wi-Fi can access them normally.
I'll investigate the issue further, including checking the DNS resolution, browser configuration, and network settings on the laptop.
I'll provide you with an update once the initial checks are complete.
Kind regards,
Thabang

Research Conducted:
Research was conducted into possible causes of specific websites failing to load while other websites remain accessible. Possible causes include DNS resolution issues, browser configuration or cache problems, incorrect network settings, and network or firewall restrictions.
Based on the information provided, the issue appears to be isolated to the Windows laptop because other devices on the same Wi-Fi network can access Microsoft Teams and SharePoint.

[Hi Lerato,](#)

Thank you for confirming these details. Since other devices on the same Wi-Fi can access Teams and SharePoint, please try the following on your Windows laptop:

- Confirm that Microsoft Edge and Microsoft Teams are updated.
- Close and reopen Microsoft Teams, then try accessing the meeting or resource again.
- Sign out of Microsoft Teams and sign back in with the correct Microsoft 365 account.
- For SharePoint, confirm that you are signed in with the correct Microsoft 365 account, verify that your internet connection is working, and reopen the SharePoint site.
- If either service continues to fail, please let me know whether the issue affects other Teams features or whether SharePoint displays an error.

TICKET 5

Wi-Fi Keeps Disconnecting — Question #39

Scenario group	Network & Performance Support
Evidence order	Screenshots are arranged from initial report to investigation, troubleshooting, confirmation, and closure.

Issue summary

The customer reported that a laptop repeatedly disconnected from Wi-Fi. Other devices on the same Wi-Fi network were not affected, and the laptop remained connected when tested on another network.

IT Support Technician view

Investigation and findings

- The fault was isolated to one laptop rather than the entire Wi-Fi network.

- The customer reported repeated disconnections during normal use.
- The laptop was stable on another network, which reduced the likelihood of a general device failure.
- The customer later confirmed that the laptop remained connected after troubleshooting.

Troubleshooting performed

1. Asked the customer to check the router or modem, restart it, and confirm that cables were secure.
2. Asked whether other devices experienced the same disconnections.
3. Asked the customer to test the laptop on another network or test the Wi-Fi connection with another device.
4. Checked the laptop's ability to reconnect automatically.
5. Reviewed wireless signal and connection stability.
6. Checked the laptop's network configuration and Wi-Fi adapter settings.
7. Disconnected and reconnected the laptop to the Wi-Fi network.
8. Retested the connection to confirm that intermittent disconnections had stopped.

Research and technical reasoning

The investigation used device comparison and another-network testing to distinguish a laptop-specific problem from a wider access-point or internet problem. The internal note records checks of reconnection behavior, signal and connection stability, network configuration, and Wi-Fi adapter settings.

Tools and systems used

- Zendesk ticket conversation and internal notes
- Wi-Fi connection status
- Wireless router or modem checks
- Laptop network configuration
- Wi-Fi adapter and power-management settings
- Cross-device and alternate-network comparison

User-friendly explanation

Wi-Fi is like a phone call. If only one phone keeps dropping while other phones in the same room stay connected, the first step is to check that phone's signal, settings, and ability to reconnect rather than replacing the entire telephone system.

Everyday analogy

The technician first acknowledged the disruption, supplied practical checks, recorded the internal investigation, asked focused follow-up questions, and closed the ticket only after the customer confirmed that the laptop stayed connected.

Customer communication

The laptop was losing its Wi-Fi connection while other devices stayed connected. The troubleshooting focused on the laptop's wireless connection and configuration, and the customer confirmed that the connection became stable.

Resolution or escalation

Resolved at first line. The customer confirmed that the laptop remained connected and the issue was resolved.

Screenshot evidence — chronological order

The upload filenames are not chronological. The sequence below follows the support workflow shown in the Zendesk conversation. Each caption identifies the purpose of the screenshot in the ticket record.

Evidence 01 — Initial acknowledgement of the Wi-Fi disconnection report

The screenshot displays a Zendesk ticket interface for a ticket titled "Wi-Fi Keeps Disconnecting". The ticket is assigned to "Zemvelo Hycent Ndlela" and is marked as "Solved". The ticket details on the left include the requester "Zemvelo Hycent Ndlela", the assignee "All Zendesk ... /Thabang No...", and the form "All Zendesk Users Forms". The ticket is currently on hold. The main content area shows a message from "Thabang Norman Lesotho" to "Zemvelo Hycent Ndlela" dated 8 minutes ago. The message reads: "Hi, Thank you for reporting the Wi-Fi disconnection issue. I understand that the repeated disconnections are interrupting your work and online meetings. I will investigate the Wi-Fi connection, network configuration and possible causes of the intermittent disconnections. I will provide you with an update once the initial checks have been completed. Kind regards, Anchor Tech Mindz". The response is signed "Thabang Anchor Tech Mindz". The right sidebar shows the user profile for "Zemvelo Hycent Ndlela" with email "zemvelo.ndlela@capaciti.o...", local time "Fri, 08:32 GMT+2", and language "English (United States)". The interaction history shows two entries for "Wi-Fi Keeps Disconnecting", both marked as "Solved". The bottom of the interface shows a "Public reply" button and a "Submit as Solved" button.

Evidence 02 — First troubleshooting instructions

Evidence 03 — Internal troubleshooting record

Evidence 04 — Follow-up questions to isolate the cause

Evidence 05 — Customer confirms the recommended checks resolved the issue

Evidence 06 — Final customer-facing closure message

Completion checklist

- Two selected scenario groups are represented.
- Five completed Zendesk tickets are documented.
- Each ticket includes an issue description, investigation, troubleshooting, research or technical reasoning, tools, customer communication, and resolution.
- The screenshots are grouped by ticket and arranged in support-process order.
- The documentation distinguishes public customer replies from internal technician notes.
- Each ticket includes both a technical view and a plain-English explanation with an analogy.
- The strongest complex scenario for a presentation walkthrough is the SharePoint and Teams access issue because it shows staged investigation, research, unsuccessful first-line checks, DNS and network troubleshooting, customer confirmation, and closure.

Recommended complex scenario

The strongest presentation case is Question #35, Unable to Access Certain Websites. It demonstrates the clearest progression from symptom discovery to isolation, research, a failed initial attempt, DNS and network remediation, validation, and customer confirmation.
